

## PROJECT DESCRIPTION

The existing Waste Nitrogen pipeline crossing the City Bridge at the Stelco Facility required replacement. It was critical that the existing line was not shut down as it was the main supply line for the area hospital as well as the steel manufacturing industries. Robert B. Somerville was responsible for the design and installation of a new 16" pipeline complete with new supports that accommodated the having the existing pipeline in full operation. Final tie-in was a Hot Tap and Stopple process that minimized down time. The existing pipeline was then removed. The work was required to allow for the widening of the bridge deck.

### Client

Air Liquide Canada Inc.

### Job Number

05003

### Work Type

Distribution Pipeline

### Location

Ontario

### Role

General Contractor
