

## PROJECT DESCRIPTION

The purpose of the work was to relocate existing residential inside gas meters to the exterior of houses to bring the meter to the outside of the residence for reading purposes and as a safety upgrade to ATCO Gas' system. All work was within Calgary, Alberta. Somerville was responsible for everything from contacting customers and making appointments, applying for and tracking locates/permits, completing all below ground work so that the existing steel line could be transitioned to plastic and a new riser installed on the exterior of the house, and completing all associated downstream piping. The below ground work involved digging either by hand or with a mini-excavator and using trenchless technology (ie. torpedo or hole hog) to run the line under ground with minimal disturbance to the customers yard. The gas line downstream of the meter was also piped to complete the moving of the gas meter. The yards were then repaired back to the same or better condition then before our work, which included such things as laying sod, pouring and finishing concrete or completing asphalt repairs. The downstream work also included completing inside repairs such as drywall or carpentry. Contract is to complete 1,300 moves in the City of Calgary.

### Client

ATCO Gas

### Job Number

12511

### Work Type

Distribution Pipeline

### Location

Alberta

### Role

General Contractor
